

Odoo Custom Card UX Report

A custom card design provided by Odoo.

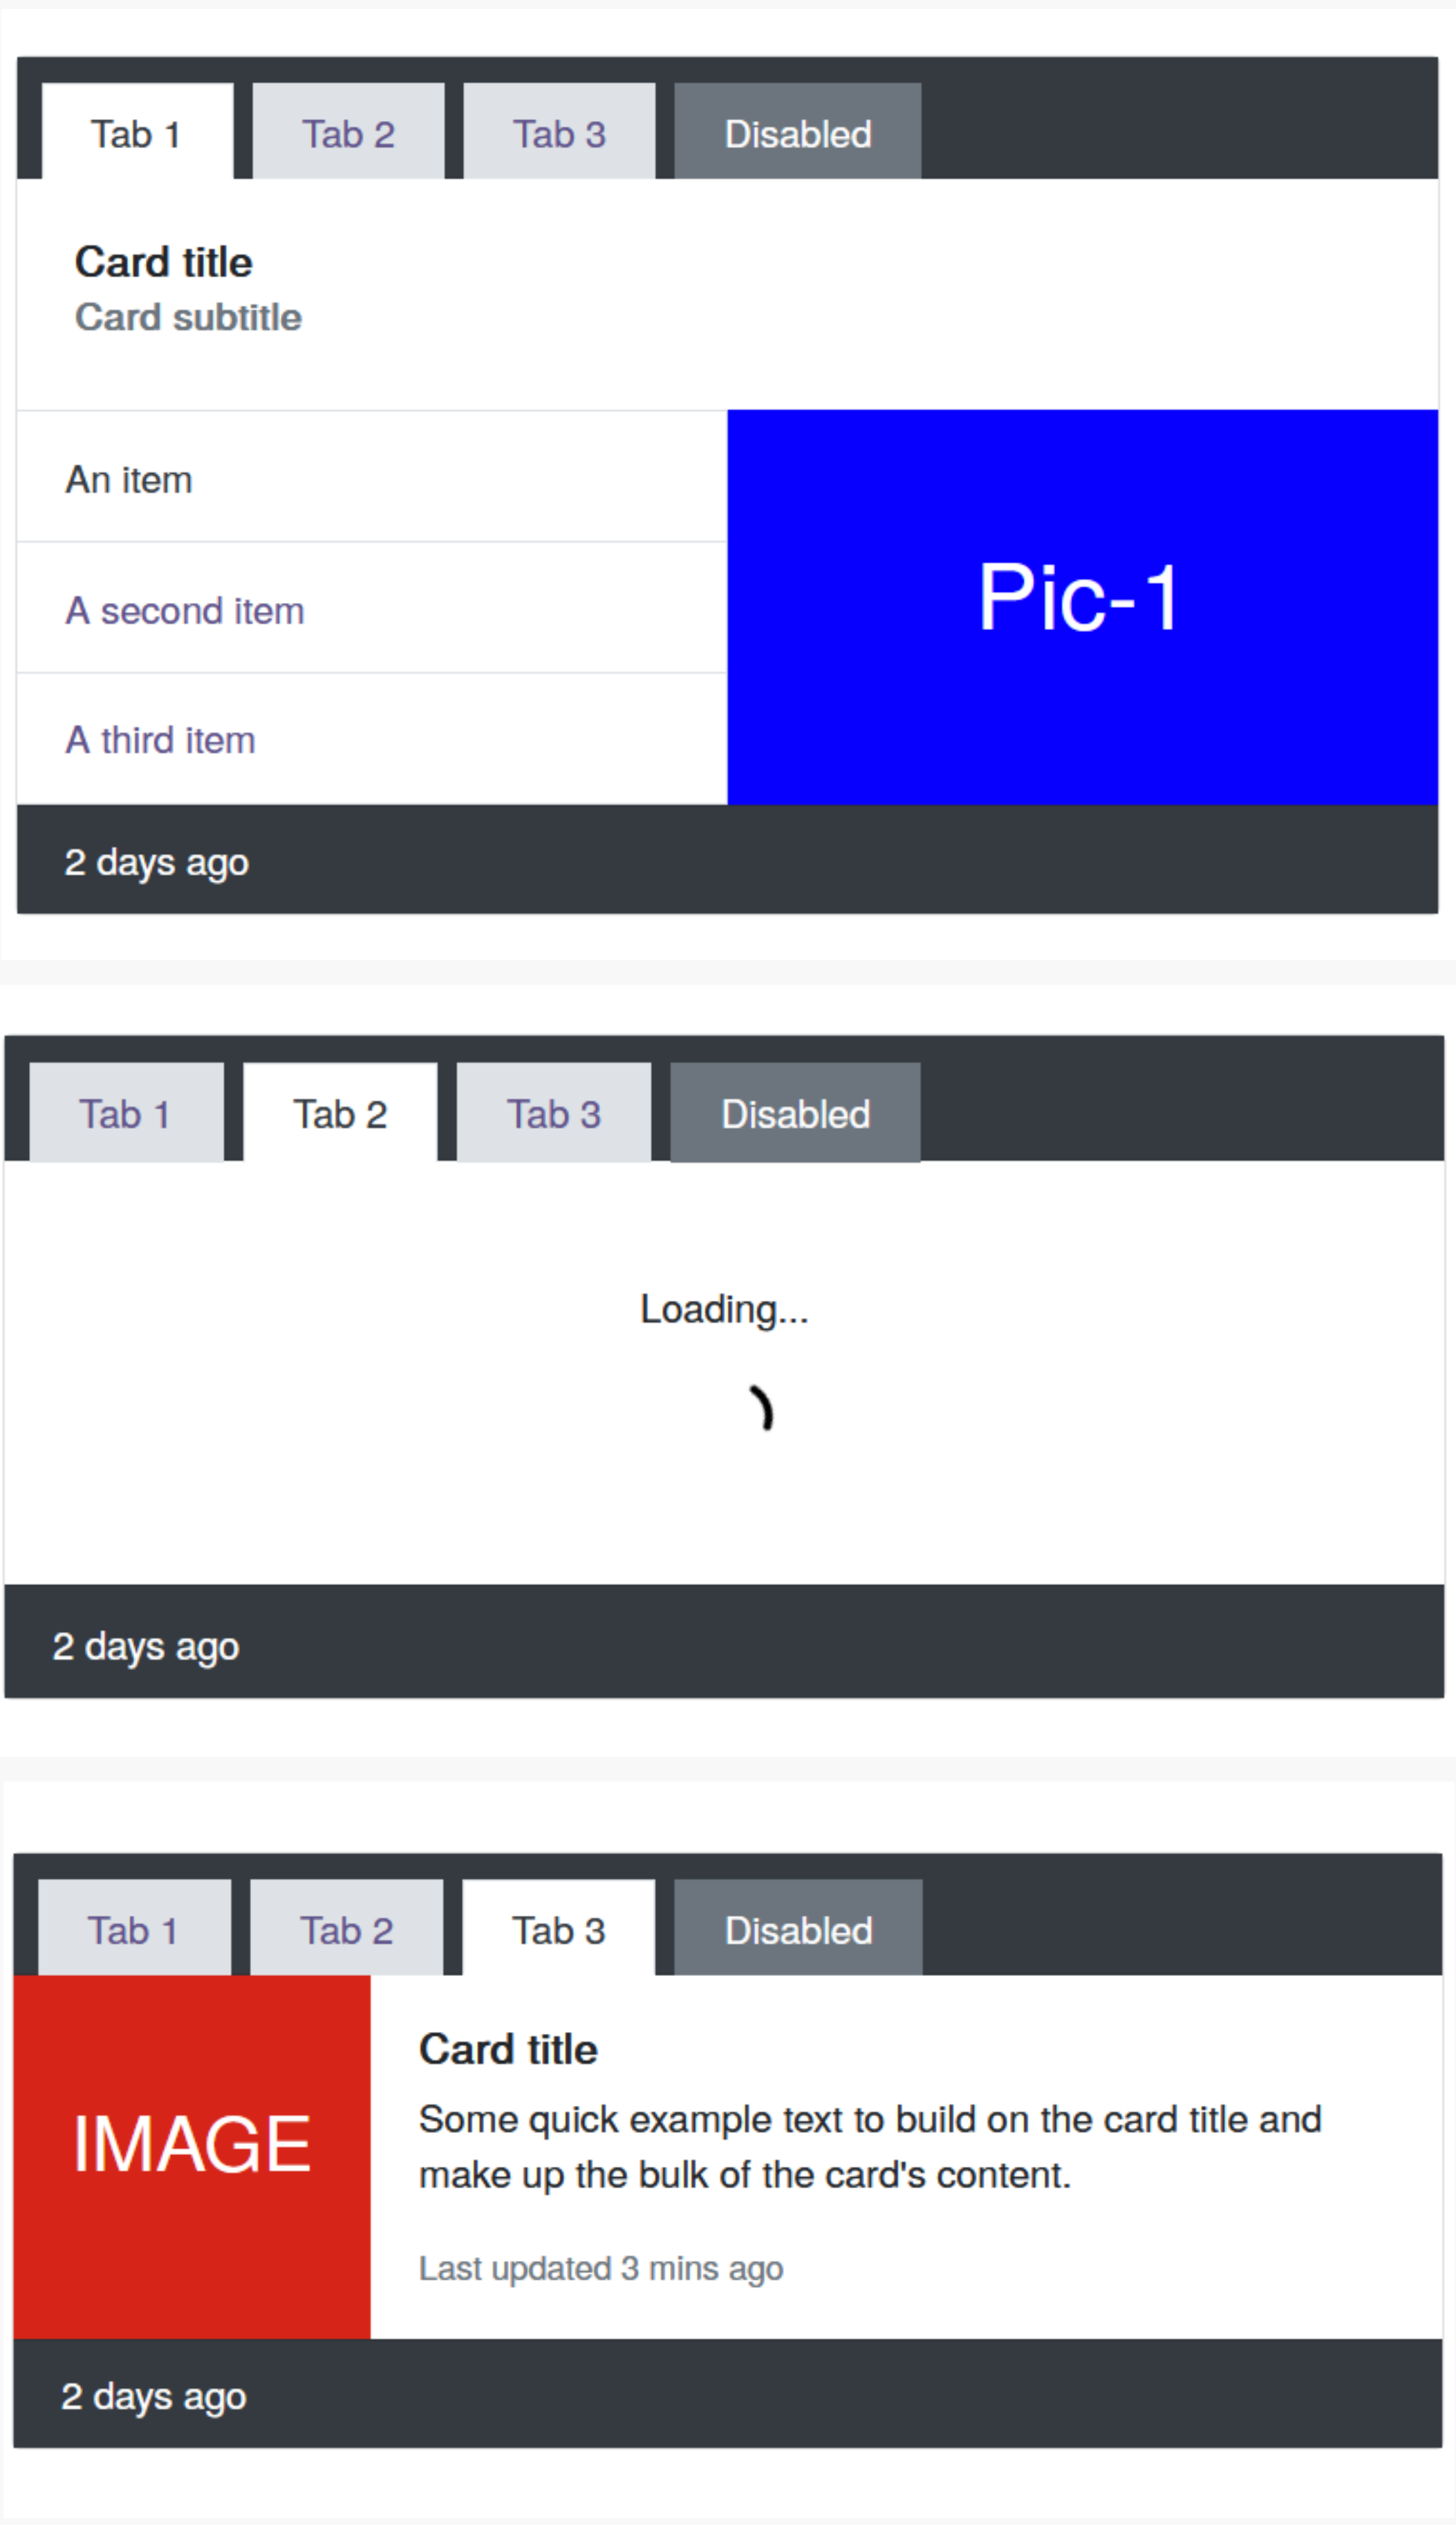

The component is a customized version of the default bootstrap card.

It consists on a main `<div>` using a `.card` class and 3 sub-sections:
A card-header containing a navigation tab
A card-body containing 3 tab bodies
A static footer

Tab1: A title and a subtitle followed by a block divided in two columns.
Clicking an entry on the left must toggle the corresponding image on the right.

Tab2: A centered "Loading.." block. The animated shape must be an inline SVG.

Tab3: Static content

Goals

- Evaluate the card for any usability issues
- Propose a solution to the issues

Issues and solutions

The current location is not clearly indicated

We don't see the active state of the tabs.
Highlight the currently selected tab. Make sure that the highlighting is prominent enough so people can tell which tab is selected.

Text and content is not legible and easily scannable.

- Presence of a border on too many elements
- Colors of header and footer are too dark
- Fonts size of the differents elements are too close.

Simplify colors and use the rigth font hierachy.

Performance inhibit the user experience

Spinner doesn't indicate the progress of the loading of content.
Might be nice to show it with a determinated loading.

Unnecessary tabs

Using a tab system when the only content that will change is an image is not user friendly. Since the only item that is changing is an image it might make more sense to a carousel for example

Cluttered displays

By placing too many elements too close together, you may overwhelm users.
The content will be more scannable if the whitespaces are better distributed.

First tab and third tab have different layout for the same type of content

Use the same layout if the content type is the same

Effects should enhance interactivity so users know if they've hovered something

We have no hover effects on the tabs.
Highlight the currently hovered tab.
